I'm very new to it and quickly got stuck, so my plan now was to upload the Wordpress standard site to a local development box and send the POST request to it and just debug the app. The problem is that I can't use the code I want to use because of a self-hosted Wordpress application on another host. So basically, I'm trying to send a HTTP POST request to localhost from another localhost machine. I have no problems with the request, but no response is sent to the sender. I'm aware that the server is actually the wordpress application, but I'm creating the request in a separate machine because I'm testing this out. As I said before, I can make the request, but I can't post anything to the server when I send the request. Here's what I have:
